Designing Human-Swarm Interaction Systems

Oscar Bjurling, 2025-02-20 Swarms of Unmanned Aerial Vehicles UAVs or drones are envisioned to transform various fields from emergency response to law enforcement and military operations Drone swarms provide scalable adaptable and decentralized solutions for dynamic work environments However the successful integration of these multi agent systems into real world settings presents significant challenges particularly in terms of how humans can safely and effectively interact with and control these systems Human Swarm Interaction HSI aims to address these challenges by exploring how human

operators can manage multiple drones in a cohesive manner even under highly complex uncertain conditions This thesis studies the problem of designing effective interaction mechanisms and interfaces for human operators to command drone swarms specifically addressing challenges such as managing a large number of drones supporting operators situational awareness and balancing between centralized and decentralized control The research highlights the necessity of rethinking conventional approaches by introducing alternative conceptual models such as the choir metaphor which re imagines drone swarms as coordinated semi centralized ensembles rather than purely emergent decentralized collectives This metaphor aims to balance the collective often unpredictable behavior of drone swarms with the predictable directed actions needed in operational environments By demonstrating how this metaphor can be operationalized in an HSI system architecture the thesis provides new avenues for conceptualizing human interaction with autonomous systems Using a design research approach incorporating multiple case study and scenario based design activities to envision future swarm application in dialogue with prospective end users the thesis develops and evaluates prototypes that embody these nuanced HSI concepts The interface prototypes draw design inspiration from Real Time Strategy RTS games These elements include group commands high level mission planning and resource pooling to create a hybrid interaction model that allows operators to maintain both a broad overview and precise control of multiple autonomous and collaborating drones Domain expert evaluations of these prototypes in contexts such as firefighting and airport management validate the practical utility of these concepts The findings emphasize the value of adopting a Human Technology Organization HTO perspective in the design of HSI systems Rather than focusing solely on the interaction between humans and technology this systems thinking approach acknowledges that drone swarms must be integrated into larger organizational frameworks such as emergency response command structures or airport ground operations teams It demonstrates that successful deployment requires accounting for the broader organizational context including roles workflows and coordination needs This holistic approach to HSI system design ensures that drone swarms not only meet technical performance criteria such as reliability responsiveness and scalability but also align with human and organizational needs facilitating their adoption and effective use in a wide range of real world scenarios Ultimately these contributions are intended to bridge the gap between theoretical models of swarm control and practical deployment advancing both the field of HSI and the broader adoption of drone swarm technologies

Integrating Artificial and Human Intelligence through Agent Oriented Systems Design Michael E. Miller, Christina F. Rusnock, 2024-08-28 This book departs from the assumption that Artificial Intelligence AI systems will provide a maximum advantage by replacing human cognitive processing Instead this book subscribes to the assumption that AI systems will provide a maximal advantage when the system is specifically designed to augment human intelligence It provides methods for designing effective systems that include one or more humans and one or more AI entities and uses the approach that assumes automation does not replace human activity but fundamentally changes the structure of human work when AI is added to existing systems Integrating Artificial and Human Intelligence through Agent Oriented Systems Design discusses the potential impact of AI on human work and life and explores why teamwork is necessary today for complex work environments The book explains the processes and methods humans employ to effectively team with one another and presents the elements of artificial agents that permit them to function as team members in joint human and artificial teams It discusses design goals and illustrates how the methods that have been used to model the complex interactions among human and artificial agents can be expanded to enable the design of interaction between them to make possible the attainment of the shared goals Model Based Systems Engineering MBSE tools that provide logical designs of human agent teams the AI within these teams training to be deployed for human and artificial agent team members and the interfaces between human and artificial agent team members are all covered MBSE files containing profiles and examples for building MBSE models used in the design approach are featured on the author's website <https://loderterresci.com> This book is an ideal read for students professors engineers and project managers associated with designing and developing AI systems or systems that seek to incorporate AI
