**Abstract:** The use of scientific computing tools is, nowadays, customary for solving problems in Applied Sciences at several levels of complexity. The great need for reliable software in the scientific community conveys a continuous stimulus to develop new and more performing numerical methods which are able to grasp the particular features of the problem at hand. This has been the case for many different settings of numerical analysis, and this Special Issue aims at covering some important developments in various areas of application.

**Keywords:** numerical analysis; numerical methods; scientific computing

## 1. Special Issue Overview

The special issue contains 15 contributions covering a number of areas of application in Numerical Analysis and Scientific Computing, which we can summarize as follows:

1. Numerical Linear Algebra [1–3];
2. Numerical solution of differential equations [4–10];
3. Geometric integration [11,12];
4. Computer graphics [13];
5. Optimization [14,15].

Below, we highlight the main results of the papers.

### 1.1. Numerical Linear Algebra

In [1], the authors study the generalized Schur algorithm (GSA), which allows to compute well-known matrix decompositions, such as the QR and LU factorizations. In particular, they use the GSA to obtain new theoretical insights on the bounds of the entries of the matrix  $R$  in the QR factorization of some structured matrices, with related applications.

In [2], the author deals with the definition of limited memory preconditioners for symmetric and positive definite matrices. The existing connections with similar preconditioners are also discussed, along with its efficient implementation. Extensive numerical tests are reported.

The authors of [3] discuss block-generalized, locally Toeplitz sequences which arise, e.g., from the discretization of many kinds of differential equations. The theoretical framework is then recalled, also completing previous results from the same authors, and a number of examples derived from the numerical solution of differential equations are worked out.

### 1.2. Numerical Solution of Differential Equations

The author of [4], who pioneered the order analysis of Runge-Kutta methods based on the theory of trees, introduces here the more general concept of stump. Stumps are then applied to the analysis

## **Guidelines For The Use Of Advanced Numerical Analysis:**

Guidelines for the Use of Advanced Numerical Analysis David Potts, 2002 It is not easy for engineers to gain all the skills necessary to perform numerical analysis This book is an authoritative guide that explains in detail the potential restrictions and pitfalls and so help engineers undertake advanced numerical analysis It discusses the major approximations involved in nonlinear numerical analysis and describes some of the more popular constitutive models currently available and explores their strengths and weaknesses It also discusses the determination of material parameters for defining soil behaviour investigates the options for modelling structural components and their interface with the soil and the boundary conditions that are appropriate in geotechnical analysis and the assumptions implied when they are used Guidelines for the use of Advanced Numerical Analysis also provides guidelines for best practice of specific types of soil structure interaction that are common in urban development and discusses the role of benchmarking exercises This authoritative book will be invaluable to practising engineers involved in urban development It will also be useful tool for geotechnical and structural engineers

**Advanced Mathematical and Computational Geomechanics** Dimitrios Kolymbas, 2003-08-25 Geomechanics is the mechanics of geomaterials i e soils and rocks and deals with fascinating problems such as settlements stability of excavations tunnels and offshore platforms landslides earthquakes and liquefaction This edited book presents recent mathematical and computational tools and models to describe and simulate such problems in Geomechanics and Geotechnical Engineering It includes a collection of contributions emanating from the three Euroconferences GeoMath Mathematical Methods in Geomechanics that were held between 2000 and 2002 in Innsbruck Austria and Horto Greece Advanced Rail Geotechnology - Ballasted Track Buddhima Indraratna, Chalachat Rujikiatkamjorn, Wadud Salim, 2023-08-14 Ballast plays a vital role in transmitting and distributing the train wheel loads to the underlying track substructure The load bearing capacity safe train speed and the levels of noise and vibration as well as passenger comfort depend on the behaviour of ballast through particle interlocking and the corresponding deformation of this granular assembly Attrition and breakage of ballast occur progressively under heavy and continual cyclic loading causing track deterioration and rail misalignment affecting safety while exacerbating the intensity of track maintenance In the absence of realistic computational models the track substructure is traditionally designed using mostly empirical approaches In this book the authors present the detailed information on the strength deformation and degradation aspects of fresh and recycled ballast under monotonic cyclic and impact loading using innovative geotechnical testing devices A constitutive model for ballast incorporating particle breakage is presented representing a more realistic stress strain response The mathematical formulations and numerical models are validated using controlled experimental simulations and fully instrumented field trials Revised ballast gradation is described to provide greater track resiliency and extended longevity The book also provides a detailed description of geosynthetics for substructure improvement considering track deterioration caused by particle degradation fouling and impeded drainage New

to this second edition are extensive discussions on subgrade soil stabilisation causes and mechanisms of soil fluidisation mud pumping under cyclic loading and preventive and remedial measures to alleviate undue instability of ballast tracks This book should prove most beneficial for final year civil engineering students and for postgraduate teaching and learning It is an ideal supplement for practising railway engineers and researchers engaged in the challenging tasks of future track design for heavier and faster trains
